

JL Industries Meets OSHA Standards with New Roof Hatch and Safety Rail Combination

Bloomington, MN -- October 14, 2009

The JL Industries division of the Activar Construction Products Group is introducing a new hatch and safety rail combination that simplifies the specification process by providing an OSHA-approved roof opening solution.

The install-ready RHG-STH System is complete with galvanized roof hatch and Saf-T-Hatch rail system. Installation time is reduced and neither the roof membrane, nor the curb, are penetrated by fasteners. With the improved design of the railing, this combination is more cost-effective than add-on railing systems. Factory installed and finished mounting brackets simplify installation of the railing. Assembly tools and hardware are included. The fully-gasketed RHG features 14 gauge construction, heavy duty hardware and cylinders with exterior-grade powder coat finish. The Saf-T-Hatch meets OSHA CFR 29-1910.232 and CFR 29-1910.27 standards for safe egress and ingress through rooftop openings. The railing is constructed of 1-5/8" galvanized steel with zinc-plated post caps and chain, and yellow powder coat finish.
